

➤ Overview of the genetic variability of genes FUT1, FUT2 and FUT3 in various pig populations

> Introduction

- Milk oligosaccharide structures are conditioned by glycosyltransferases, including **fucosyltransferases** (FUT)
- FUT gene family :
 - In humans : **11** genes (FUT1 → FUT11)
 - In pigs : **9** genes (FUT1 → FUT4, FUT7 → FUT11)
- Our focus : genes **FUT1, FUT2 and FUT3**
 - Involved in formation of Lewis blood group antigens
 - If the enzyme is inactive : decreased diversity in milk oligosaccharides
- Our **goal** : study the variability of the FUT1, FUT2 and FUT3 genes in various pig populations
 - Are there alleles **specific** to some breeds?
 - Are there alleles that produce **non-functional** enzymes?

> Fundamentals

- In eukaryotes, protein-coding genes can have introns and exons
 - **Introns** are removed during the mRNA maturation process
 - **Exons** remain in the final mature mRNA and carry the coding sequence (CDS)

INRAE

> Fundamentals

- Function of protein determined by its shape and AA sequence

> What is a variant ?

- When a genome is sequenced, it can be aligned on a **reference genome**
- If the sequence is different, it is called a **variant**
- Different types of variants :

Reference	CAGTATGCTA
SNP	CAGT T TGCTA
Deletion	CATT - TGCTA
Insertion	CATT A GTGCTA

- Variants can impact the protein produced :
 - SNP in coding sequence (CDS) :
 - New codon codes for the same AA (synonymous)
 - New codon codes for a different AA (missense)
 - New codon is STOP (nonsense)
 - Insertion/deletion (indel) in CDS :
 - Reading frame shifts (frameshift)

➤ What is a variant ?

- Variants can impact the protein produced :
 - SNP in coding sequence (CDS) :
 - New codon codes for the same AA (**synonymous**)
 - New codon codes for a different AA (**missense**)
 - New codon is STOP (**nonsense**)
 - Insertion/deletion (**indel**) in CDS :
 - Reading frame shifts (**frameshift**)

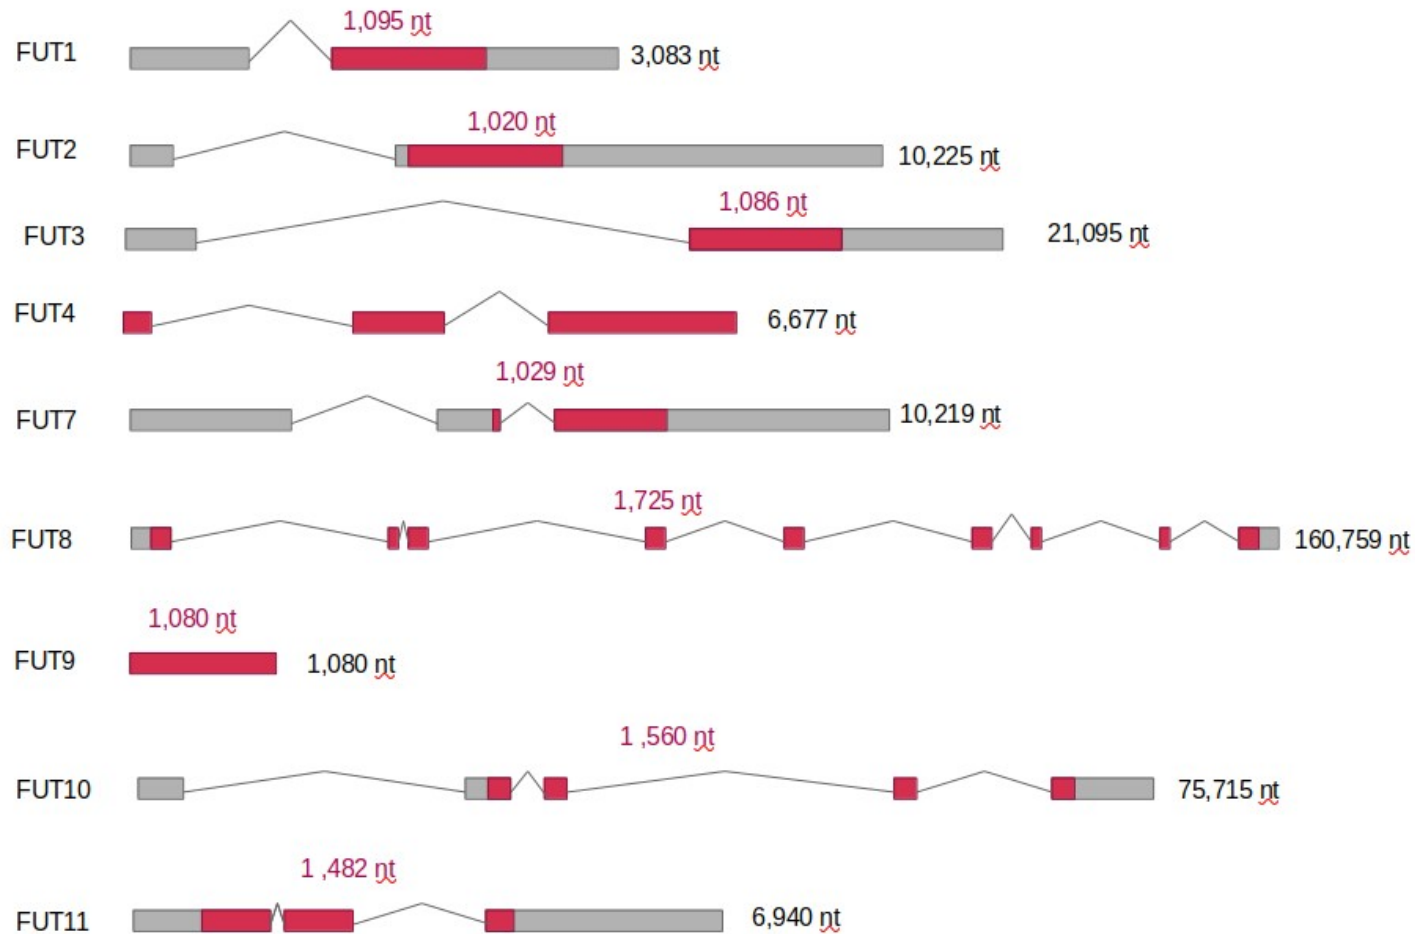

Reference	DNA	ATGCATGTGTATAGGCCA
	AA	M H V Y R P
Insertion	DNA	ATGCATGTGTAAATAGGCCA
	AA	M H V STOP

- Variants outside of CDS (UTR, introns, down/upstream) :
 - Promoters and regulatory regions can be affected

➤ FUT genes in pigs

- Great variability in terms of gene structure (length, number of exons/introns, etc...)

➤ FUT genes in pigs

- Great variability in terms of gene structure (length, number of exons/introns, etc...)

For humans :
Lewis group a/b : FUT2, FUT3
Lewis group x/y : FUT1, FUT3

➤ Lewis groups and HMOs

Group 1: Secretor, Lewis-positive (Se+Le+)

Lewis a-b+

Group 2: Nonsecretor, Lewis-positive (Se-Le+)

Lewis a+b-

Group 3: Secretor, Lewis-negative (Se+Le-)

Lewis a-b-

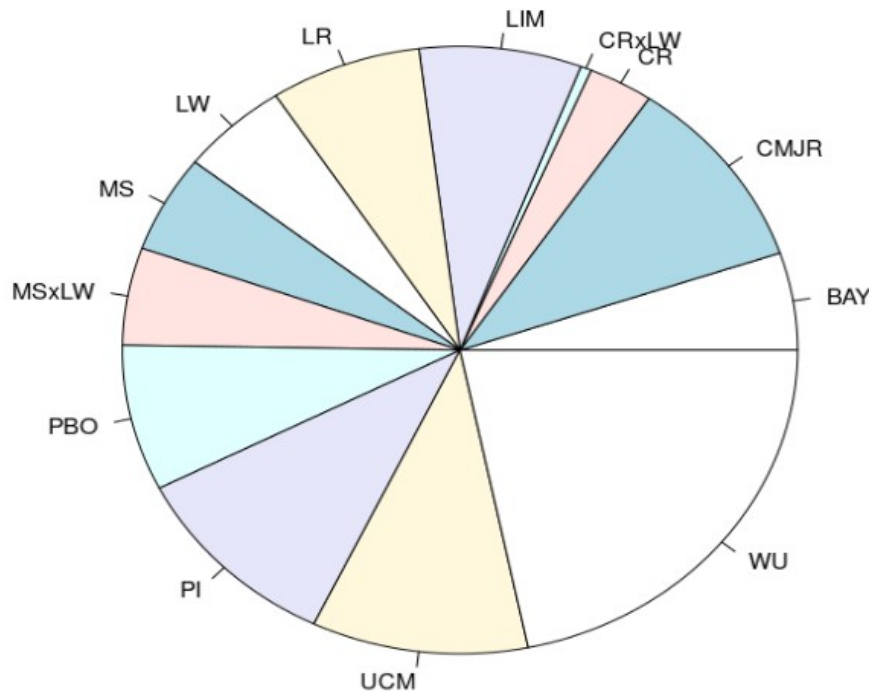

Group 4: Nonsecretor, Lewis-negative (Se-Le-)

Lewis a-b-

> Our goal

- Examine variants and haplotype (unique variant combination) diversity of FUT1, FUT2 and FUT3 across multiple pig populations
 - Use available data : 194 animals
 - 2 unknown populations : WU and UCM

BAY	10
CMJR	20
CR	6
CRxLW	1
LIM	15
LR	14
LW	10
MS	10
MSxLW	10
PBO	15
PI	20
UCM	20
WU	42

> FUT1, FUT2 and FUT3 variants

- Annotation with VEP
- Filters:
 - Quality ≥ 30
 - Biallelic only

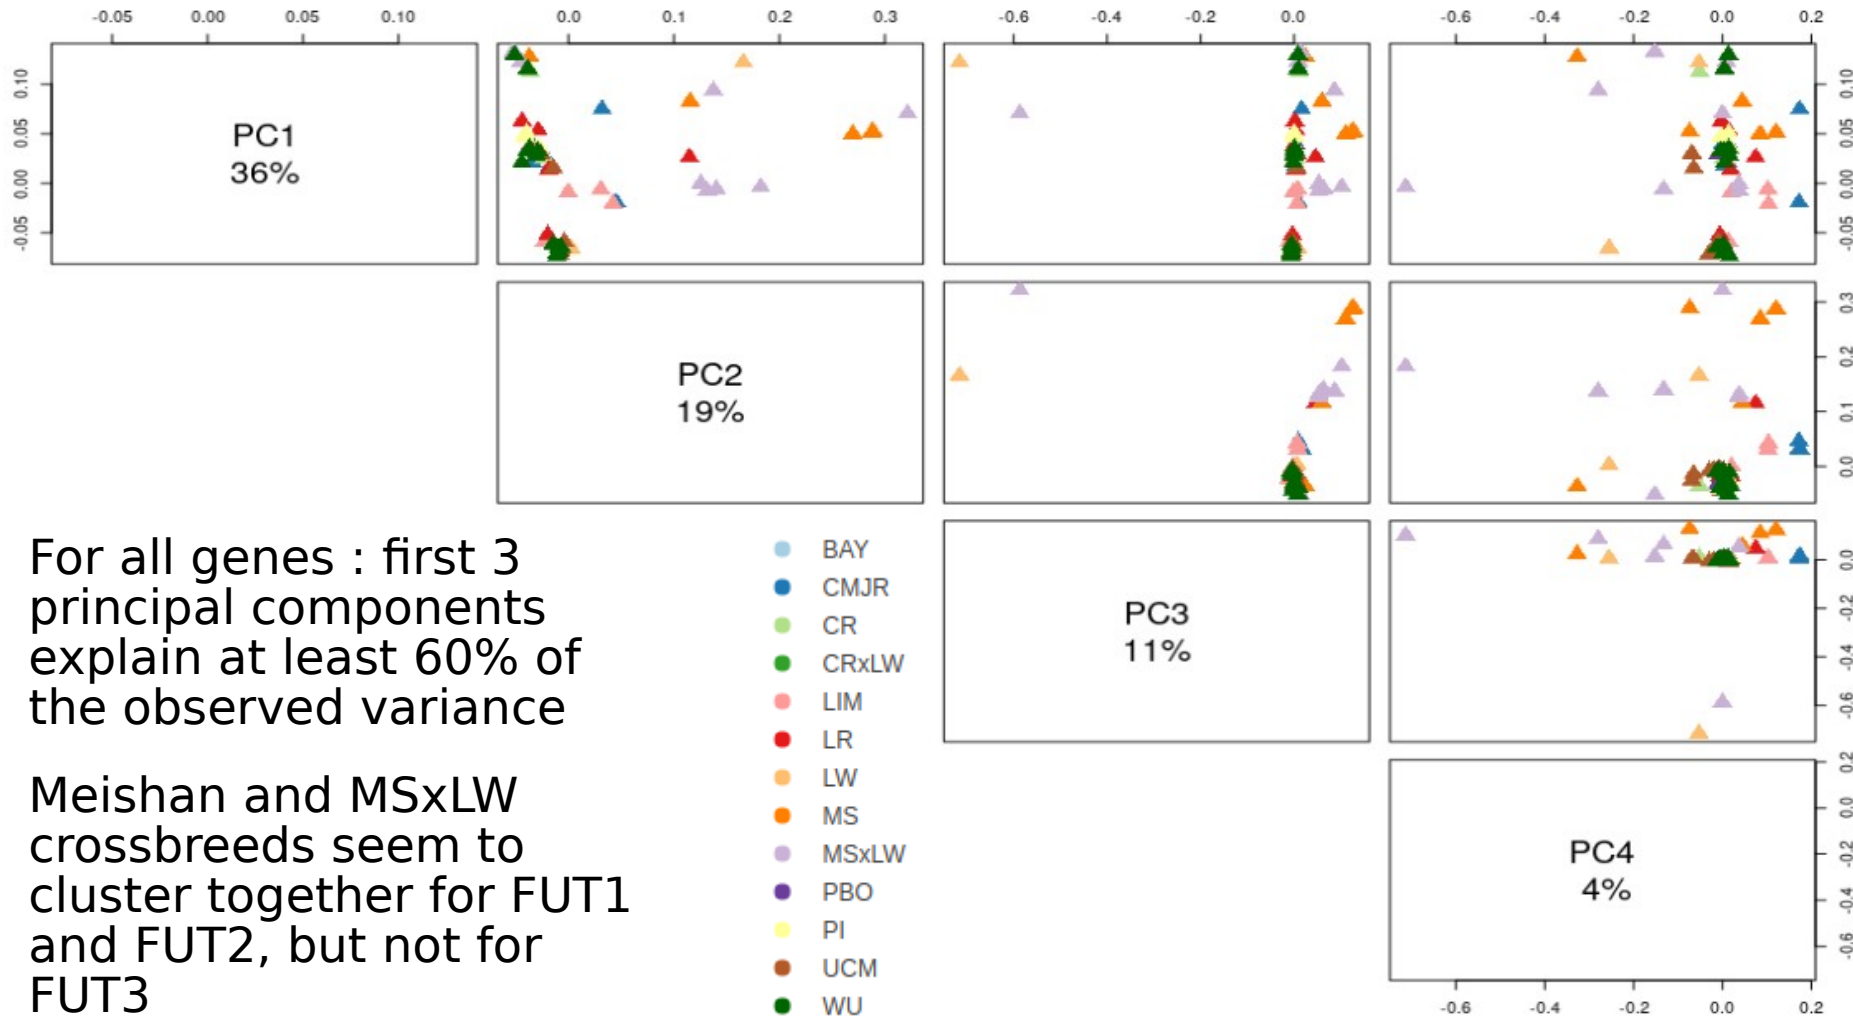

Variant consequence	FUT1	FUT2	FUT3
Frameshift variant	2	0	2
Missense variant	7	4	2
Synonymous variant	3	3	4
5' UTR variant	1	0	0
3' UTR variant	6	45	2
Intron variant	3	91	277
Upstream gene variant	9	36	19
Downstream gene variant	12	7	9
Splice donor 5th base variant	0	0	1
Stop gained	0	1	0
TOTAL	43	187	316

INRAE

FUT1, FUT2
11/04/2022

➤ PCA - FUT1

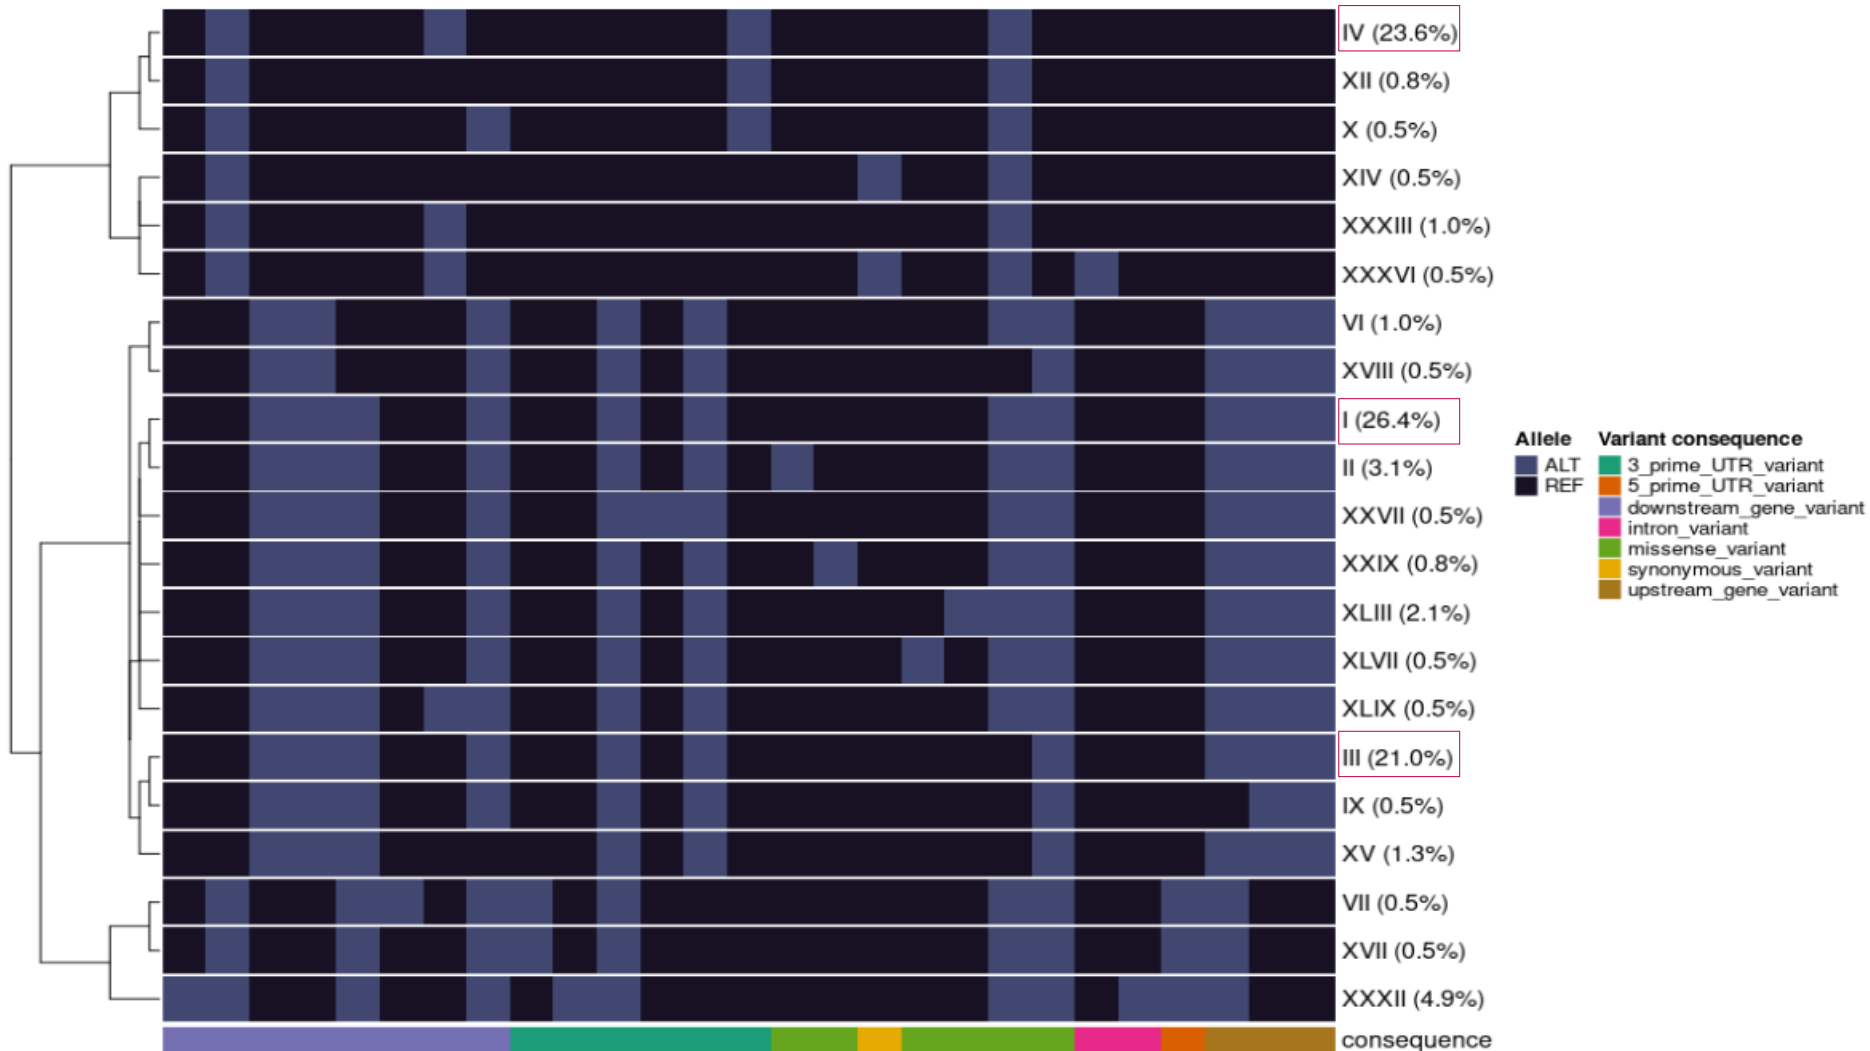

- For all genes : first 3 principal components explain at least 60% of the observed variance
- Meishan and MSxLW crossbreeds seem to cluster together for FUT1 and FUT2, but not for FUT3

➤ Majority haplotypes - FUT1

- 55 haplotypes in total, 25 observed at least twice

➤ Majority haplotypes in overall population

- FUT1:
 - I (26,4%)
 - III (21%)
 - IV (23,6%)
 - Total : 71%
- FUT2:
 - IV (31,1%)
 - V (17,4%)
 - II (7,3%)
 - Total : 55,8%
- FUT3
 - I (38,6%)
 - II (25,4%)
 - Total : 64%

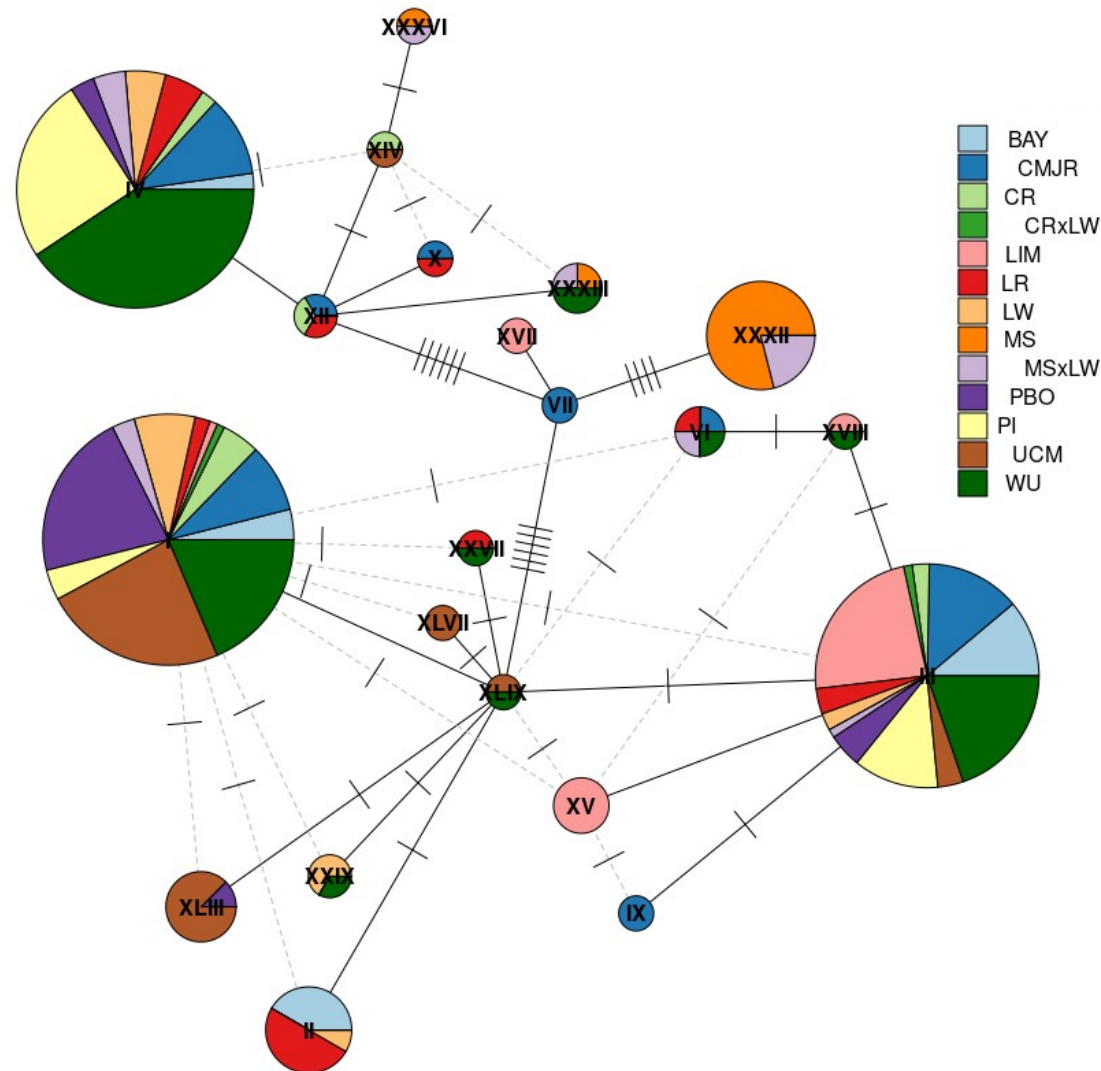

➤ Haplotype distribution across populations - FUT1

INRAE

FUT1, FUT2 and FUT3 variability
11/04/2023

➤ Haplotype distribution across populations - FUT1

➤ Haplotype combinations

FUT1, FUT2 and FUT3 variability

11/04/2023

> Conclusions

- No strong evidence of inactive FUT1, FUT2 or FUT3
- FUT3 highly conserved
- Meishan population distinct for FUT1 and FUT2, less for FUT3
- Work reproducible and compatible with other genes
- **Perspective :**
 - Apply to other FUT genes
 - Compare variants found with human variants

➤ Thank you !

➤ PCA - FUT2

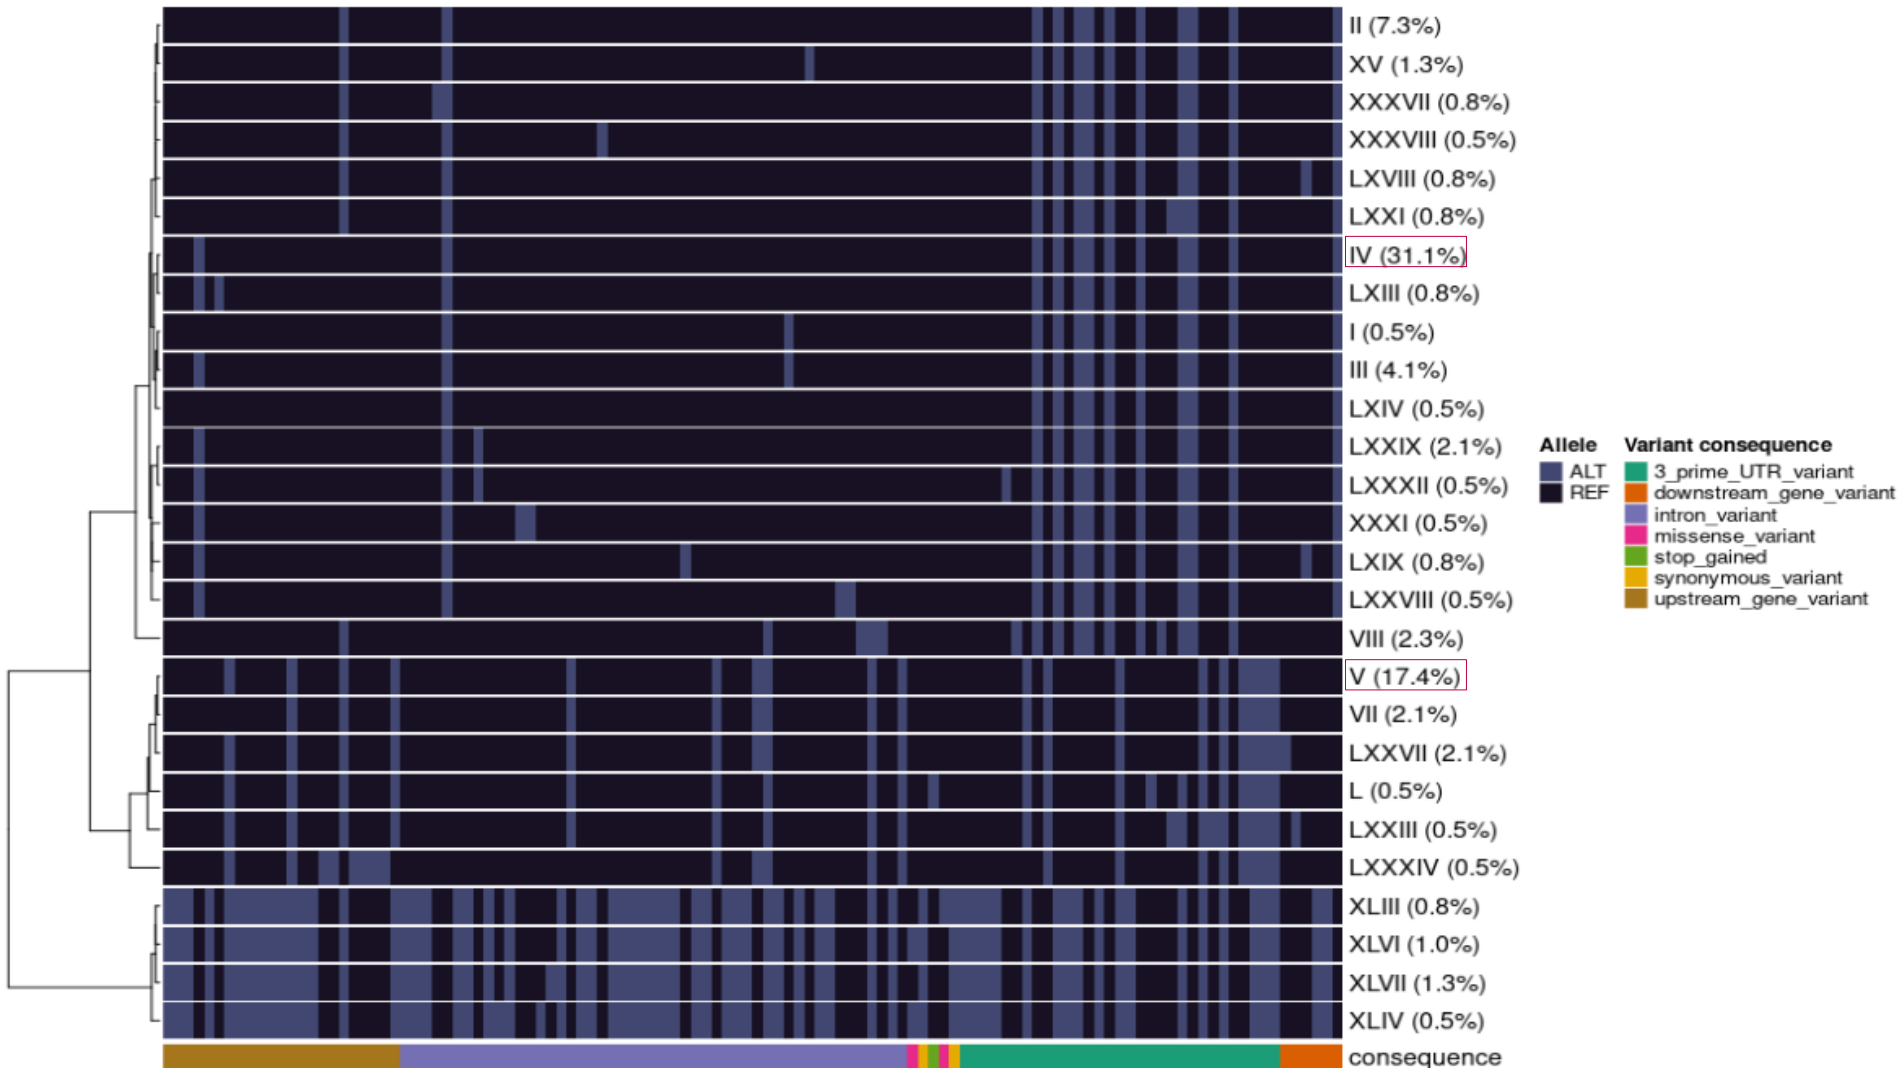

➤ PCA - FUT3

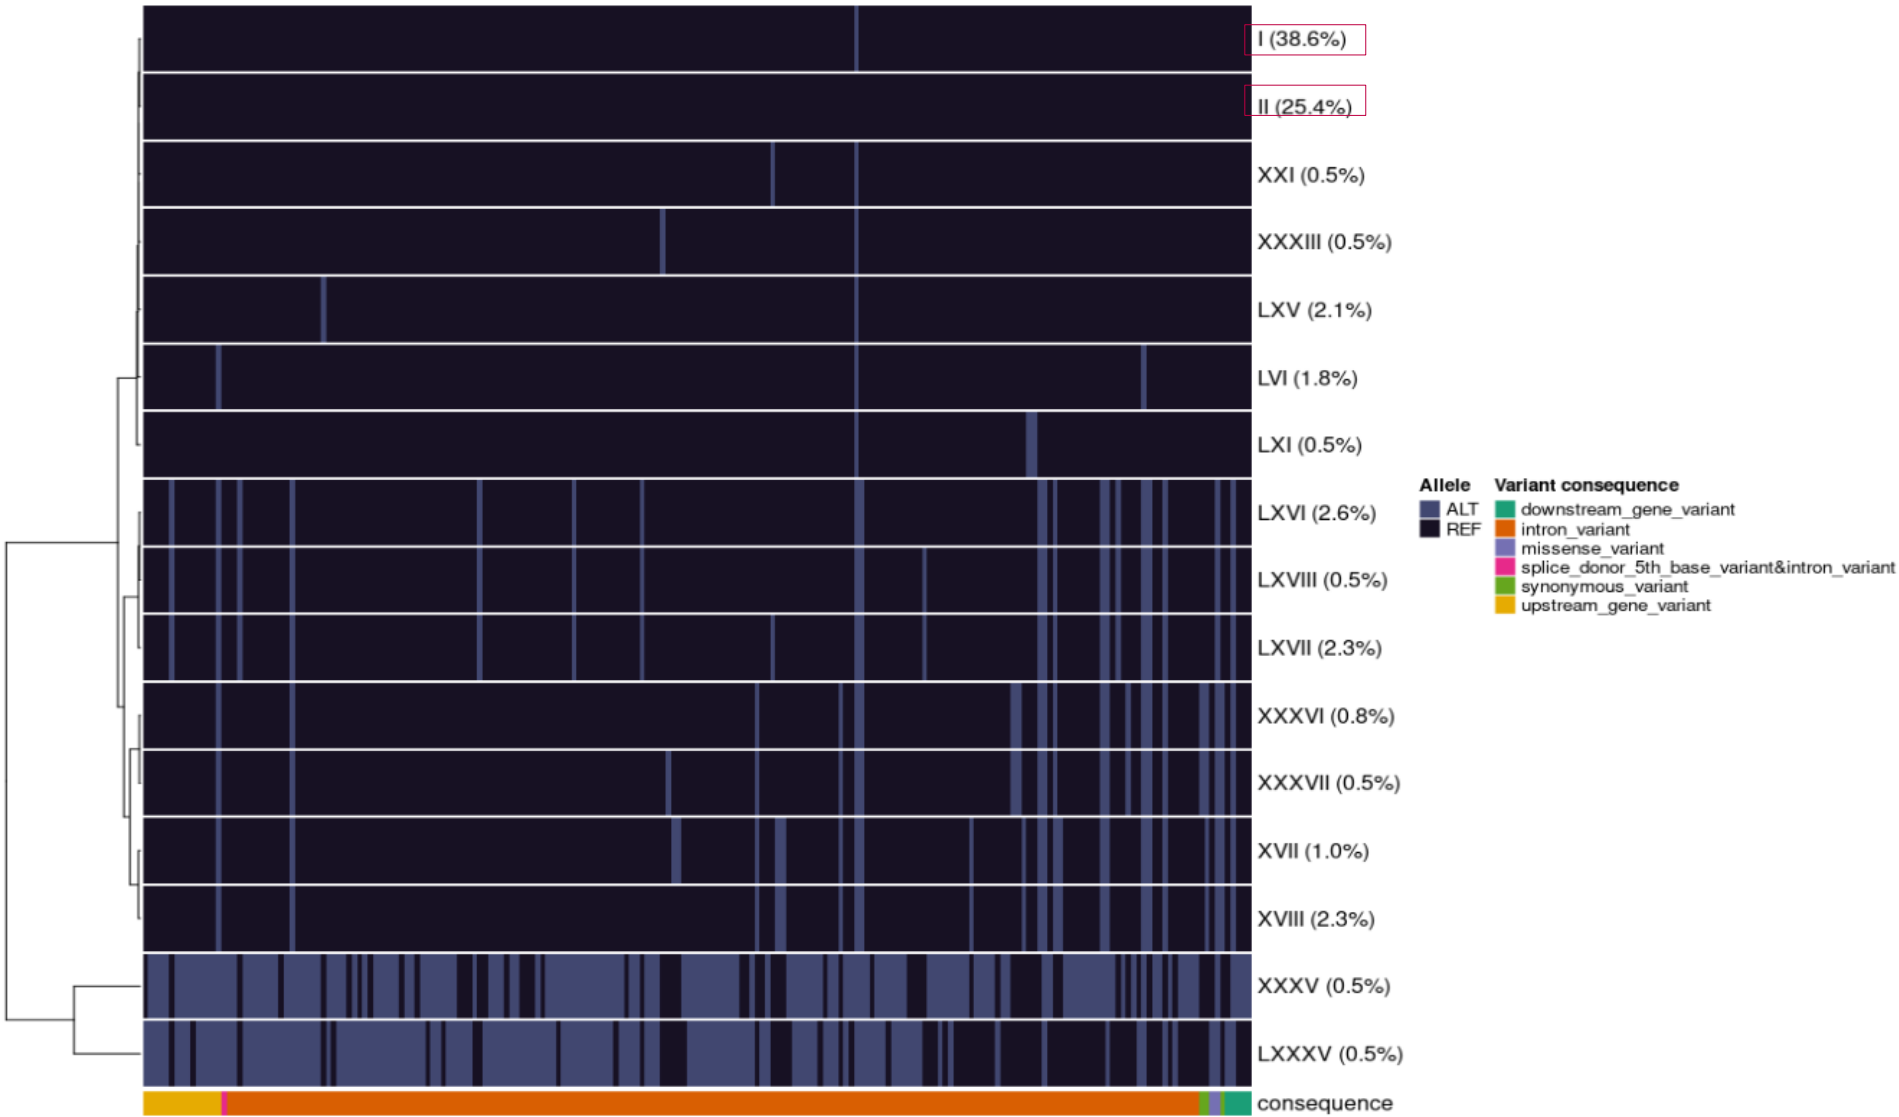

➤ Majority haplotypes - FUT2

- 97 haplotypes in total, 27 observed at least twice

➤ Majority haplotypes - FUT3

- 91 haplotypes in total, 16 observed at least twice

➤ Haplotype distribution across populations - FUT2
